HEATCRAFT UPGRADES LARKIN REFRIGERATION PRODUCTS

ATLANTA, February 14, 2003 — Heatcraft Refrigeration Products has upgraded the Larkin line of industrial refrigeration products to include new models, features and design improvements.

The upgraded Larkin refrigeration system features a new layout that offers more space to access the front panel. The front facing electrical board makes this design customer friendly and the additional space in the electrical cavity allows for easier installation and service to existing parts.

The solenoid wire comes standard, is attached to the sheet metal panels and located at the bottom of the unit, which makes installation easier. The upgraded system boasts enlarged coil heater slots for simple installation and replacement, and reduced heater wattages to conserve energy.

The upgraded Larkin system is fully compatible with the Beacon II system and has a cutout window in the front panel for LED readouts. The new Larkin Compak Unit Cooler is factory installed and pre-charged for ease of installation and convenience.
